Results

Upon obtaining the results, a significant pattern I noticed in the data analysis is the winning percentage shows that candies that are fruity or is neither chocolate or fruity have the lowest percentages, meaning, there the least popular types of candies. Meanwhile as the win percent rate starts gradually increasing, those types of candies were primarily chocolates being the most popular halloween candies, with Reeseś Peanut Butter Cups perched at the top, at a whopping 84%. And the least popular candy being Nik L nip, at a low 22%.
